

**PROFILE**

Software engineer. I design and ship complete web platforms - customer journey, online payment, business back-office - and integrate third-party systems through their APIs. I have also carried applied-AI projects into production, including an enterprise assistant that my employer sold to a client. Comfortable from development in React, Node.js and Python through to deployment and the tooling the business teams actually use.

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>EXPERIENCE</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2023<br>Final-year project        | <b>Full-Stack &amp; AI Developer</b> - AURAX <ul style="list-style-type: none"><li>- A catalogue alone does not convert: delivered the entire customer journey in MERN (React, Node.js, Express, MongoDB) - search and filters, cart, secure online payment via Stripe, promotion codes, confirmation, order tracking and history.</li><li>- Making every change depend on a developer is expensive: built a self-service back-office where the business team manages catalogue, pricing, promotions and stock, with a revenue and orders dashboard.</li><li>- White-label customisation: logo, colours and the site announcement banner editable by the administrator with no technical involvement.</li><li>- Content-based recommendation engine (VGG16 to PCA to KNN) exposed through a Flask API, working from a user's first visit with no history.</li><li>- Delivered in a pair inside the company: JWT token authentication, code versioned on GitLab, tasks tracked in Linear.</li></ul> |
| 02/2026 - 07/2026<br>Lac 1, Tunis | <b>AI Engineer Intern</b> - TELNET Holding <ul style="list-style-type: none"><li>- Project information was scattered across three third-party systems: delivered an enterprise assistant that queries Jira, Confluence and GitLab through their APIs and answers in natural language from a single interface. TELNET sold the product to a client.</li><li>- Cut response time 2.4x (7.3s to 3.0s) through deterministic query routing and API calls executed in parallel.</li><li>- Built the quality gate the project lacked: an evaluation framework scoring every answer, so no fine-tuning cycle ships without a demonstrated gain - model reliability improved 27%.</li><li>- Shipped ready to operate: Docker-containerised FastAPI services, MongoDB persistence, local inference via Ollama and a React/Vite console for day-to-day control, with quality, latency and failures monitored in production.</li></ul>                                                                        |

|                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                              |
